Overview

Why centrality measures?

Degree centrality

Closeness centrality

Betweenness centrality

Katz, Eigenvector, and PageRank centralities

Girvan-Newman community detection

Why Centrality Measures?

Centrality Use Cases

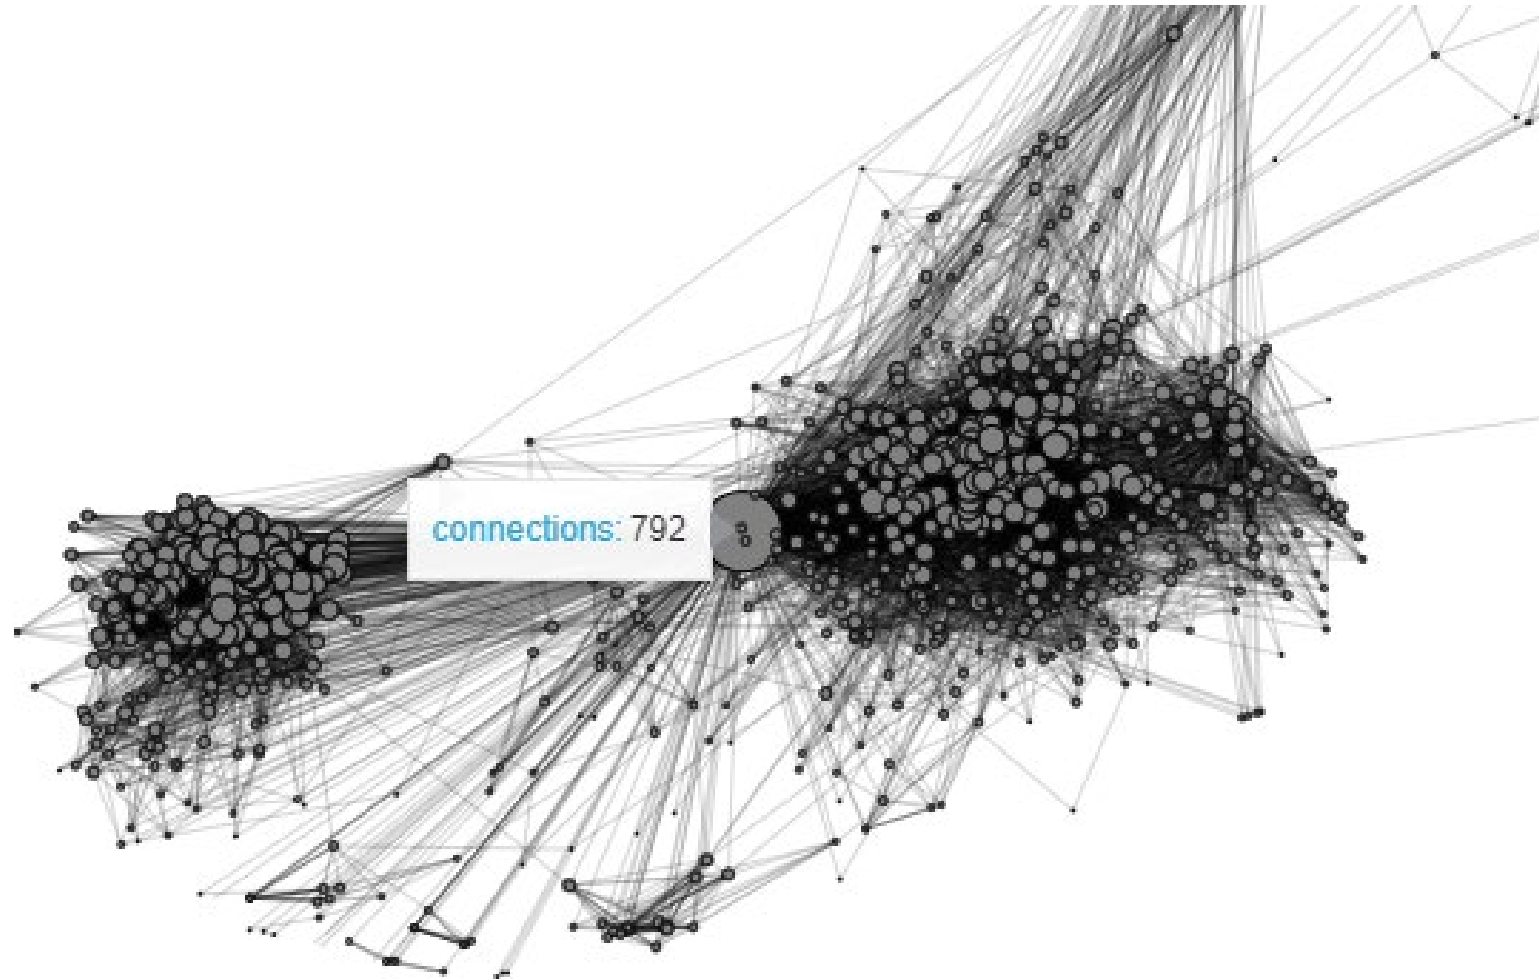

**Influencer
identification in
social networks**

**Bottleneck
identification in
transportation
networks**

**Pandemic
prevention in virus
spread networks**

Degree Centrality

Different Centrality Measures

Betweenness

Closeness

Eigenvector

Degree

Harmonic

Katz

Girvan-Newman Algorithm

Degree Centrality

Undirected Degree

Directed Degree

Sources and Sinks

$$\Delta = \frac{D_{in}}{D_{out}}, D_{out} \neq 0$$

$$\Delta = D_{in} - D_{out}$$

Sources and Sinks

$$\Delta = \frac{D_{in}}{D_{out}}, D_{out} \neq 0$$

$$\Delta = D_{in} - D_{out}$$

Degree Centrality in NetworkX

Closeness Centrality

Closeness Centrality

Measures how close a node is, on average, to all the other nodes in the network.

Closeness Example

Closeness Example

Closeness Example

Closeness Example

Closeness Example

Closeness Example

Closeness Centrality Formulation

$d(u, v) :=$ minimum number of hops
or sum of weights from node u to node v

Closeness Centrality Formulation

$d(u, v) :=$ minimum number of hops
or sum of weights from node u to node v

$$C'(u) = \frac{\sum_{v=1}^{n-1} d(u, v)}{n - 1}$$

Closeness Centrality Formulation

$d(u, v) :=$ minimum number of hops
or sum of weights from node u to node v

$$C(u) = \frac{n - 1}{\sum_{v=1}^{n-1} d(u, v)}$$

High Closeness

Path	Min. Distance
6 to 2	1
6 to 3	1
6 to 4	1
6 to 5	1
6 to 1	2

$$C(6) = \frac{6 - 1}{1 + 1 + 1 + 1 + 2} = 0.83$$

Low Closeness

Path	Min. Distance
1 to 2	1
1 to 3	2
1 to 5	2
1 to 6	2
1 to 4	3

$$C(1) = \frac{6 - 1}{1 + 2 + 2 + 2 + 3} = 0.5$$

Closeness Caveat

K_5 graph

$$C(\text{Any node}) = \frac{5 - 1}{1 + 1 + 1 + 1} = 1$$

Delivery Center Placement

```
nx.closeness centrality(G)
```

Closeness Centrality in NetworkX

Betweenness Centrality

Betweenness Centrality

Measures the extent to which a node serves as a bridge or interchange hub to other nodes.

Betweenness Example

Betweenness Formulation

$paths(s, t) := \text{number of } \textbf{shortest} \text{ paths between nodes } s \text{ and } t$

Betweenness Formulation

$paths(s, t) :=$ number of **shortest** paths between nodes s and t

$$paths(1, 4) = 2$$

Betweenness Formulation

$paths(s, t) :=$ number of ***shortest*** paths between nodes s and t

$paths(s, t|u) :=$ number of ***shortest*** paths between nodes s and t
going through u

Betweenness Formulation

$paths(s, t) :=$ number of **shortest** paths between nodes s and t

$paths(s, t|u) :=$ number of **shortest** paths between nodes s and t
going through u

$$C(u) = \sum_{\substack{\text{For every pair of} \\ \text{nodes } s \text{ and } t}} \frac{paths(s, t|u)}{paths(s, t)}$$

Betweenness Example

$$\frac{paths(s, t|1)}{paths(s, t)}$$

Community Detection: Girvan-Newman Algorithm

Communities

Edge Betweenness Example

Girvan-Newman Intuition

Assumption: if two nodes are connected by an edge with high betweenness centrality, those nodes are likely to be part of separate communities.

Conversely, if they are connected by an edge with low betweenness centrality, they are likely to be part of the same community.

Demo

Detecting communities in NetworkX

Summary

Many centrality measures because many notions of “center” in a network

- Degree centrality for identifying local leaders
- Closeness centrality for identifying nodes on average closest to all other nodes
- Betweenness centrality for identifying bridges and communication hubs

Katz and Eigenvector are great for identifying global influence

- Katz gives more control, but Eigenvector has reasonable defaults

PageRank is similar to Eigenvector but adjusted for directed networks

Girvan-Newman used to detect levels of communities algorithmically
